What?	So What?	Now What?
Our software development company has been commissioned to create a platform for the organisation CheckYourCar for end users to get alerts in an easy way to find when their car has been involved in a recall which aims to improve safety.	So far as a team we should start planning for this project by establishing the requirements of our customer and find out who their end users are and cater for this. We will be using a code first approach meaning we will code our framework and UI/UX design and security in parallel.	We have started our coding, design and planning with success and have already made significant progress, which will place us in a good position to make further changes and perfect our project.
